Driveri Release 10/26/2021

Here's what's new with Driveri!

What's New

Portal

- Added Support to Configure Speed Thresholds in Units Configured for the Fleet
  – Fleets can configure the Speed unit in MPH (default) or KPH. Previously, users could only configure the speed thresholds in MPH on the Provisioning & Configurations > Configurations page.
  – The portal experience has been enhanced to allow users to configure the thresholds in the unit configured for the Fleet, either MPH or KPH. This ensures a consistent experience for users of Fleets using KPH as Speed unit across the portal.

- Added Support for Vehicles in Groups
  – Driveri Portal now supports assigning vehicles to groups. The feature can be enabled by the users from the Provisioning & Configurations -> Configurations page under the Groups Settings.
  – These groups are not meant to match groups in the GPS Insight portal, and should be considered separate.
  – In order for the tenant to have access to them, a SuperUser must first enable the feature in the Configurations menu (Config > Groups > Edit).
  – This feature is available for Protection and Prevention users.

Alerts

- Added Two Additional Compound Alerts
  – Two additional compound alerts, Driver Distracted + Hard Brake and Following Distance + Hard Brake are now available. These can be found on the Compound Alerts tab on the Alerts page and the Driver profile page.
  – Driver Distracted + Hard Brake: When the driver was distracted for more than a few seconds (Talking on Phone, Looking at Phone, or Looking Down) and braked hard.
  – Following Distance + Hard Brake: When the driver did not maintain a safe distance with the next vehicle ahead and braked hard.
  – This feature is limited to Prevention users only.
